Detailed Breakdown of Chapter 16 Workbook Answers

Below, we provide a comprehensive overview of common questions and the corresponding answers found in Miller Levine's workbook for Chapter 16. This can serve as a helpful reference for students reviewing the chapter.

1. Define evolution and explain its significance in biology.

Answer:

Evolution is the change in the genetic makeup of a population over successive generations. It explains the diversity of life on Earth and how species adapt to their environments. Evolution is significant because it provides a scientific explanation for the origins of species, their relationships, and the mechanisms behind biological diversity.

2. Describe the concept of natural selection and its four main principles.

Answer:

Natural selection is the process by which individuals with advantageous traits are more likely to survive and reproduce, passing those traits to the next generation. The four main principles are:

- Variation: Individuals within a population vary in their traits.
- Inheritance: Traits are heritable and passed from parents to offspring.
- Differential Survival and Reproduction: Some individuals have traits that better suit their environment, leading to higher survival and reproductive success.
- Adaptation: Over time, advantageous traits become more common within the population.

3. List and describe types of evidence that support the theory of evolution.

Answer:

- Fossil Records: Show changes in species over time and transitional forms.
- Comparative Anatomy: Homologous structures reveal common ancestry.
- Molecular Biology: DNA and protein comparisons demonstrate genetic relationships.
- Embryology: Similarities in early development suggest relatedness.
- Biogeography: Distribution of species supports evolution and speciation in different environments.

4. Explain the difference between genetic variation and genetic mutation.

Answer:

Genetic variation refers to differences in the genetic makeup among individuals within a population, which can result from mutations, gene flow, recombination, and sexual reproduction. Mutation is a change in the DNA sequence, which can introduce new genetic variations. Mutations are a primary source of genetic diversity and can be beneficial, harmful, or neutral.
